Recursive Digit Sum

We define super digit of an integer $m{x}$ using the following rules:

Given an integer, we need to find the *super digit* of the integer.

- If x has only 1 digit, then its super digit is x.
- ullet Otherwise, the super digit of $oldsymbol{x}$ is equal to the super digit of the sum of the digits of $oldsymbol{x}$.

For example, the super digit of 9875 will be calculated as:

Example

```
n = '9875'
```

k = 4

The number p is created by concatenating the string n k times so the initial p = 9875987598759875.

All of the digits of p sum to 116. The digits of 116 sum to 8.8 is only one digit, so it is the super digit.

Function Description

Complete the function *superDigit* in the editor below. It must return the calculated super digit as an integer.

superDigit has the following parameter(s):

- string n: a string representation of an integer
- int k: the times to concatenate n to make p

Returns

• *int:* the super digit of n repeated k times

Input Format

The first line contains two space separated integers, n and k.

Constraints

• $1 \le n < 10^{100000}$

• $1 \le k \le 10^5$

Sample Input 0

```
148 3
```

Sample Output 0

```
3
```

Explanation 0

Here n=148 and k=3, so p=148148148.

```
super_digit(P) = super_digit(148148148)
= super_digit(1+4+8+1+4+8+1+4+8)
= super_digit(39)
= super_digit(3+9)
= super_digit(12)
= super_digit(1+2)
= super_digit(1+2)
= super_digit(3)
= 3
```

Sample Input 1

```
9875 4
```

Sample Output 1

```
8
```

Sample Input 2

```
123 3
```

Sample Output 2

```
9
```

Explanation 2

Here n=123 and k=3, so p=123123123.
